

Meeting Minutes 10-8-2020

From last year's team member:

- We will need felt tips for better recordings from last years device
- R/W are confirmed to be the two reference electrodes
- Last years team only had time to do one testing session of the eyes closed test before covid
- The potentiometers are the interactable filters
- We can look at the last year's BOM for lists of where and what parts they got.

Kate reiterated her stackable circuit card design, which is what we plan on going with moving forward in order to save space.

Kate also asked if there was an extension to easily port over the board from last year into the PCB program.

We decided that there will be ~4 electrodes for the rat edition.

One of our stretch goals is the games for the device.

With the upcoming WikiPage, Kate and Mohamed volunteered to maintain this page since they are already in charge of documentation.

From the CS majors:

- The GUI is the major part that needs to be worked on
- Most likely going to have to build the program from scratch as none of the previous models are very reliable.
