

Design Iteration 4-16-2015

Features:

- A) The 3 holes for mounting sensors have been moved to the front for better accessibility
- B) A major redesign has been done regarding how the cover seals against the project box. Testing revealed that the neoprene o-ring was too stiff, it requires much more pressure than this system can exert. We found closed-cell foam neoprene sheet and are designing this area around this new material. There is no longer a need for a channel, and no need for an overhang, so these items were deleted.
